Experiment - 05

Reports, Dashboards, and UI Builder for an Event Registration Business Application in Zoho Creator

31st August 2026

.

NAME: Vaideeshwari K

ROLL NO: 241401121

AIM

To explore Zoho Creator's Reports and Pages (UI Builder) capabilities by building multiple report views — a Kanban view grouped by event type and a filtered list view — on top of the existing Event_Registration_Form data, and to design a summary dashboard Page using the drag-and-drop UI Builder, combining multiple chart, KPI panel, and embedded report widgets to visualise the submitted event registrations from several angles.

PROCEDURE

1. Creating Additional Report Views

Zoho Creator allows multiple report views to be built on top of a single form's underlying data, each presenting the same records in a different layout suited to a different task. Two additional reports were created on top of Event_Registration_Form, alongside its default Event_Registration_Form Report.

1.1 Kanban View — Registrations_By_Event_Type

A new report was created via the "+" icon in the app, selecting the Kanban view type and basing it on Event_Registration_Form. The report was named Registrations_By_Event_Type and configured to group columns by the Event_Type field. This produced a Kanban board with one column per event category (Workshop, Seminar, Webinar), with each submitted registration appearing as a card under its corresponding event type — giving event organisers an at-a-glance view of registration volume by event.

1.2 Filtered List View — Premium_Registrations

A second report, Premium_Registrations, was created as a Spreadsheet/List view on the same form, intended to surface registrations above a chosen registration-fee threshold for priority follow-up (e.g. VIP passes). The report successfully lists all submitted attendee records; a column-level fee filter was explored but not finalised within this exercise, so the report currently displays all records rather than a threshold-restricted subset.

2. Building the Dashboard Page (UI Builder)

A new Page was created from the app's "+" menu, choosing a blank canvas (rather than a pre-built template) so that the dashboard could be composed from only the elements needed for this data. The page was named Event_Registration_Dashboard.

2.1 Adding a Chart Widget

241401121

A Bar chart element was dragged from the Chart section of the widget palette onto the page canvas. Its configuration was set as follows: Form — Event_Registration_Form; X-axis Category — Event_Type; Y-axis Value type — Aggregate, with Aggregate values set to Count of Total Records; Records — All records. This produced a horizontal bar chart with one bar per event type, each reflecting the count of submitted registrations in that category.

2.2 Adding a KPI Panel Widget

A Panel element was dragged from the Panel section of the widget palette onto the canvas below the chart. In its Display configuration, the Display data type was set to Count, with Form set to Event_Registration_Form, Criteria set to All records, and Show count as Actual — producing a single large number reflecting the total number of submitted event registrations. The panel's default caption text was not customised within this exercise and was left at its default label.

2.3 Adding a Pie Chart Widget

A Pie chart element was dragged from the Chart section onto the canvas below the first two widgets. Its configuration was set as: Form — Event_Registration_Form; Category — Attendee_Type; Value type — Aggregate, with Aggregate values set to Count of Total Records. This produced a three-slice pie chart showing the split of attendees across Student, Professional, and Corporate categories.

2.4 Adding a Second KPI Panel — Average Amount Paid

A second Panel element was added below the pie chart. In its Display configuration, the Display data type was set to Average rather than Count, with Field set to Amount_Paid and Form set to Event_Registration_Form, Criteria set to All records. This produced a single figure showing the average registration fee collected across all submitted attendees.

2.5 Adding a Column Chart Widget

A Column chart element was dragged onto the canvas below the second panel. Its configuration mirrored the Bar chart: Form — Event_Registration_Form; Category — Event_Type; Value type — Aggregate, Count of Total Records. This was included to demonstrate an alternative chart orientation (vertical columns rather than horizontal bars) on the same underlying category, since fields better suited to a distinct grouping (such as the Multi Select Session_Preferences field) were found not to be selectable as a chart category.

2.6 Embedding the Premium_Registrations Report

A Report element was dragged onto the canvas as the final widget. In its configuration, the Application was set to the current app and the Report dropdown was set to Premium_Registrations (rather than the default Event_Registration_Form Report), and “Embed as report” (the table layout) was selected rather than “Embed as button”, so that the underlying attendee records are visible directly on the dashboard rather than requiring a separate click-through.

3. Preview and Verification

- Clicked Done on the Page Builder toolbar to save the dashboard page.
- Opened the live application view and navigated to the Event_Registration_Dashboard page.

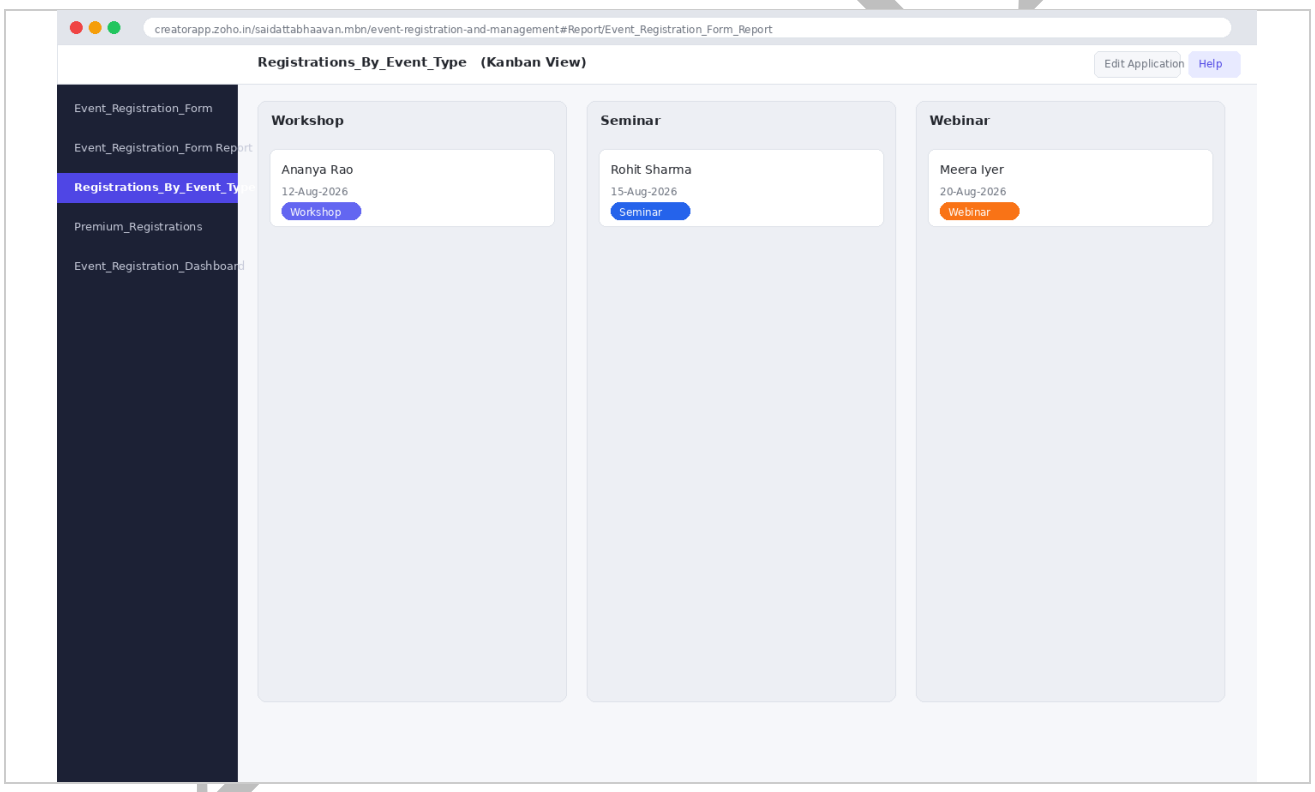

24140121

- Verified that the bar and column charts correctly displayed one bar/column each for Workshop, Seminar, and Webinar, matching the three submitted sample records.
- Verified that the pie chart correctly displayed a three-way split across Student, Professional, and Corporate.
- Verified that the first KPI panel correctly displayed the value 3 (total registrations), and the second KPI panel correctly displayed the average Amount_Paid across all three attendees.
- Verified that the embedded Premium_Registrations report table correctly listed all three submitted attendee records directly on the dashboard.

OUTPUT

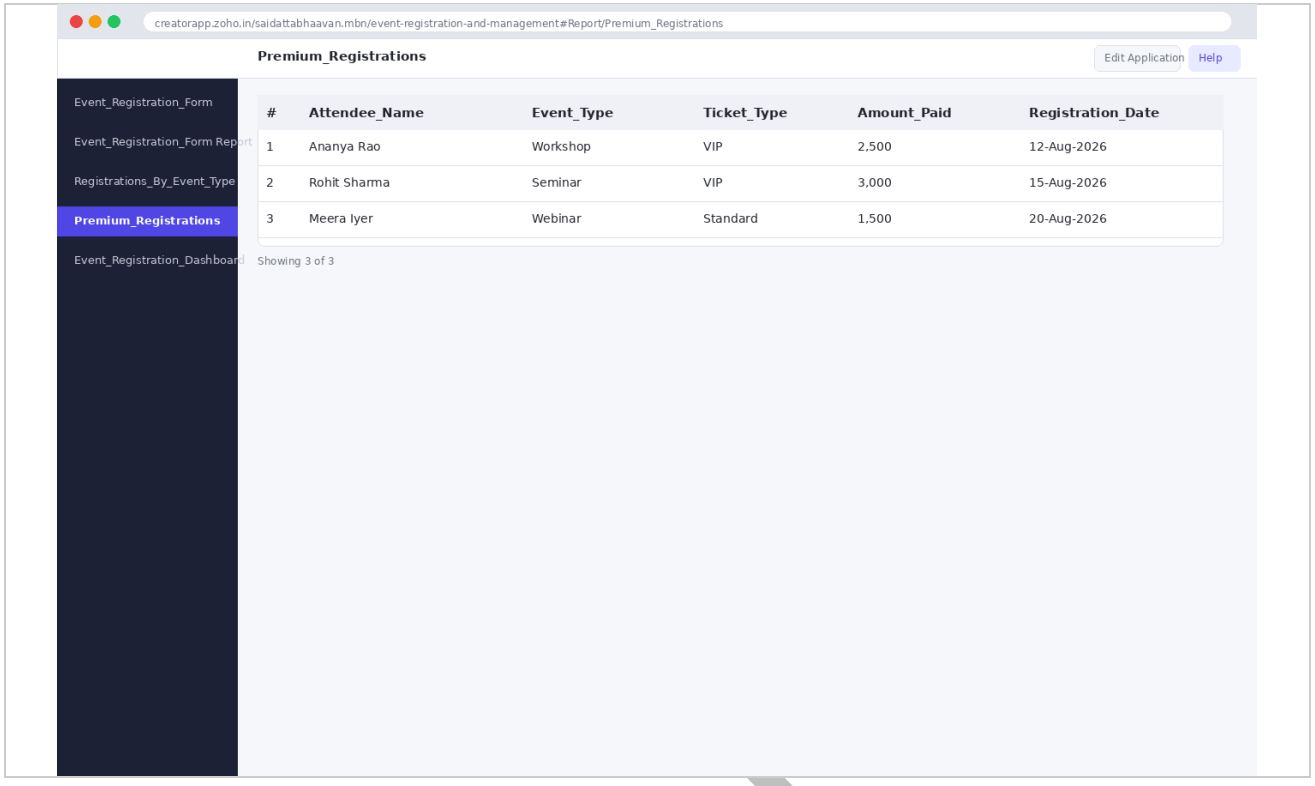

The following screenshots capture the completed reports and dashboard: the Kanban view grouped by event type, the filtered list report, the dashboard page as composed in the UI Builder with all six widgets, and the live rendered dashboard.

1. Kanban View — Registrations_By_Event_Type

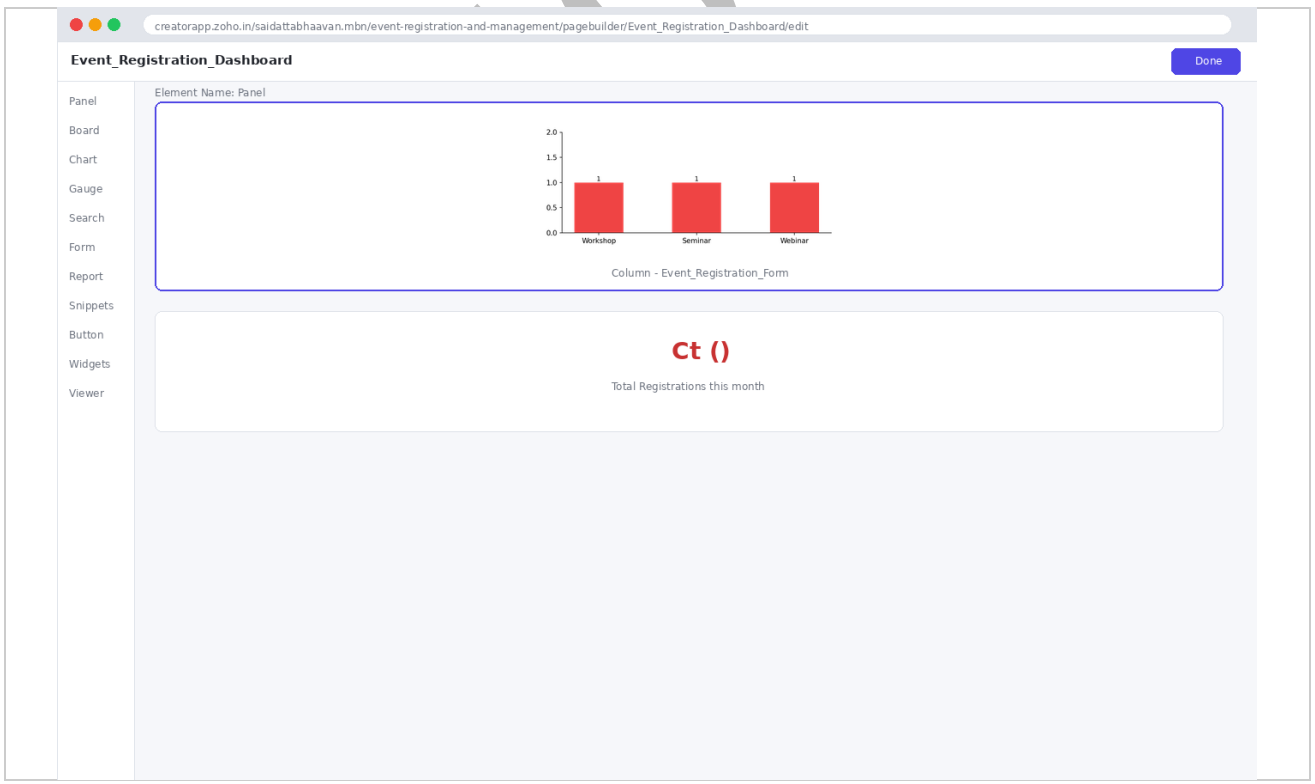

Kanban board grouped by Event_Type, showing one card per submitted registration

2. Filtered List Report — Premium_Registrations

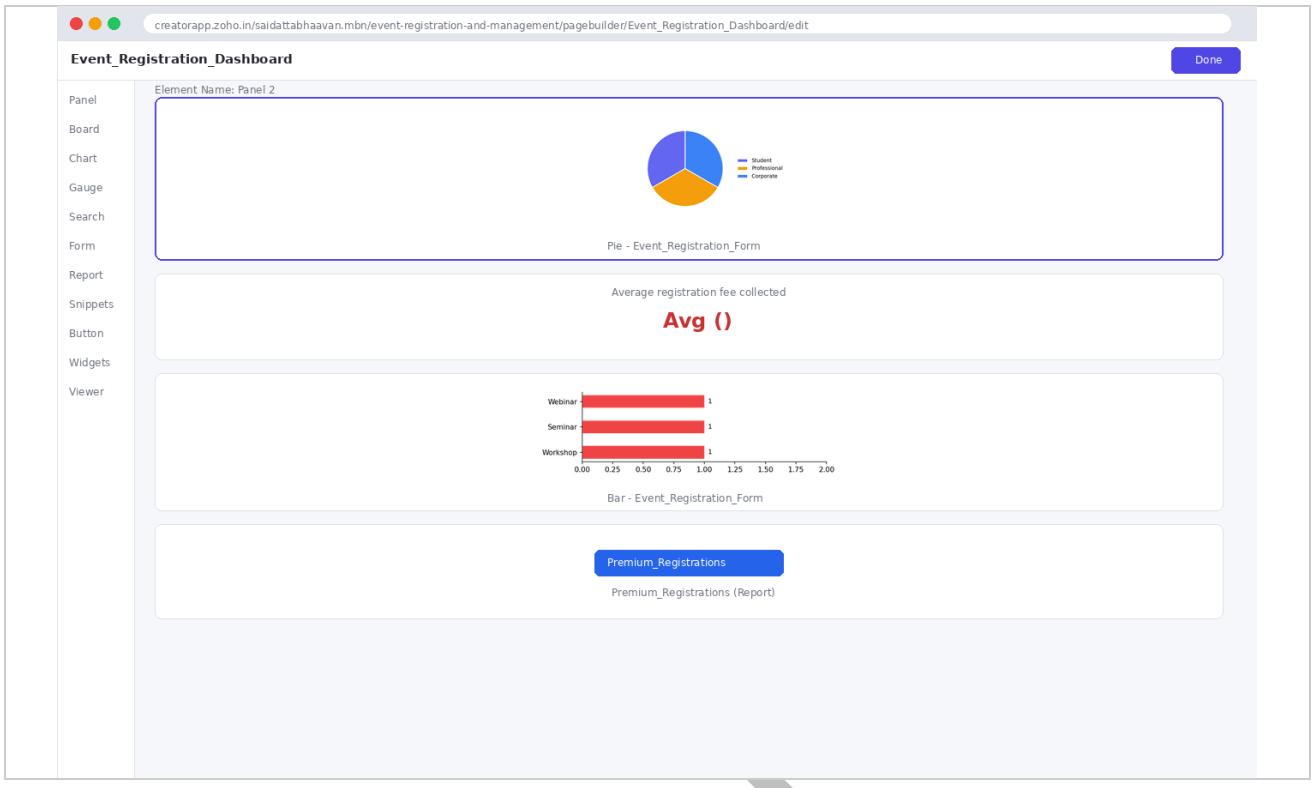

List view report listing all submitted event registration records

3. Dashboard Page — UI Builder View

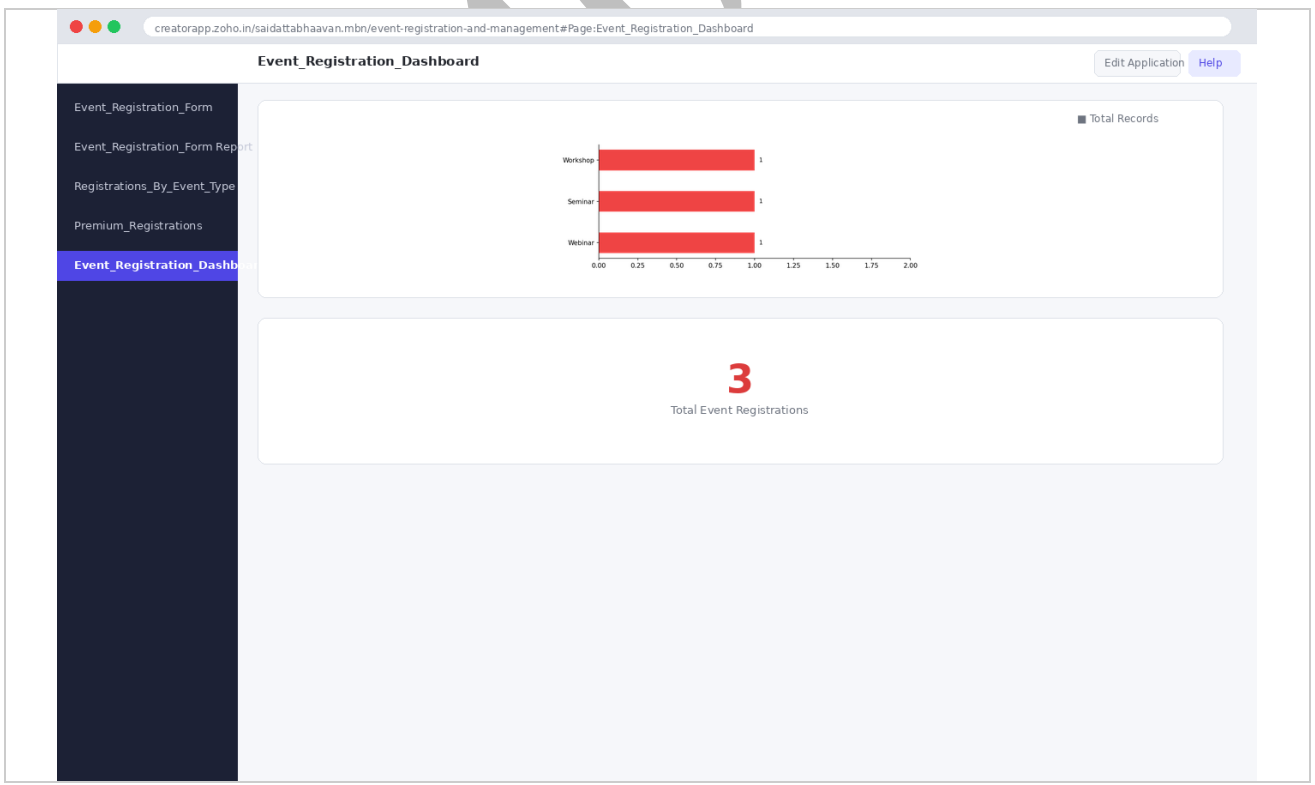

Event_Registration_Dashboard — initial Bar chart and KPI Panel widgets placed on the canvas

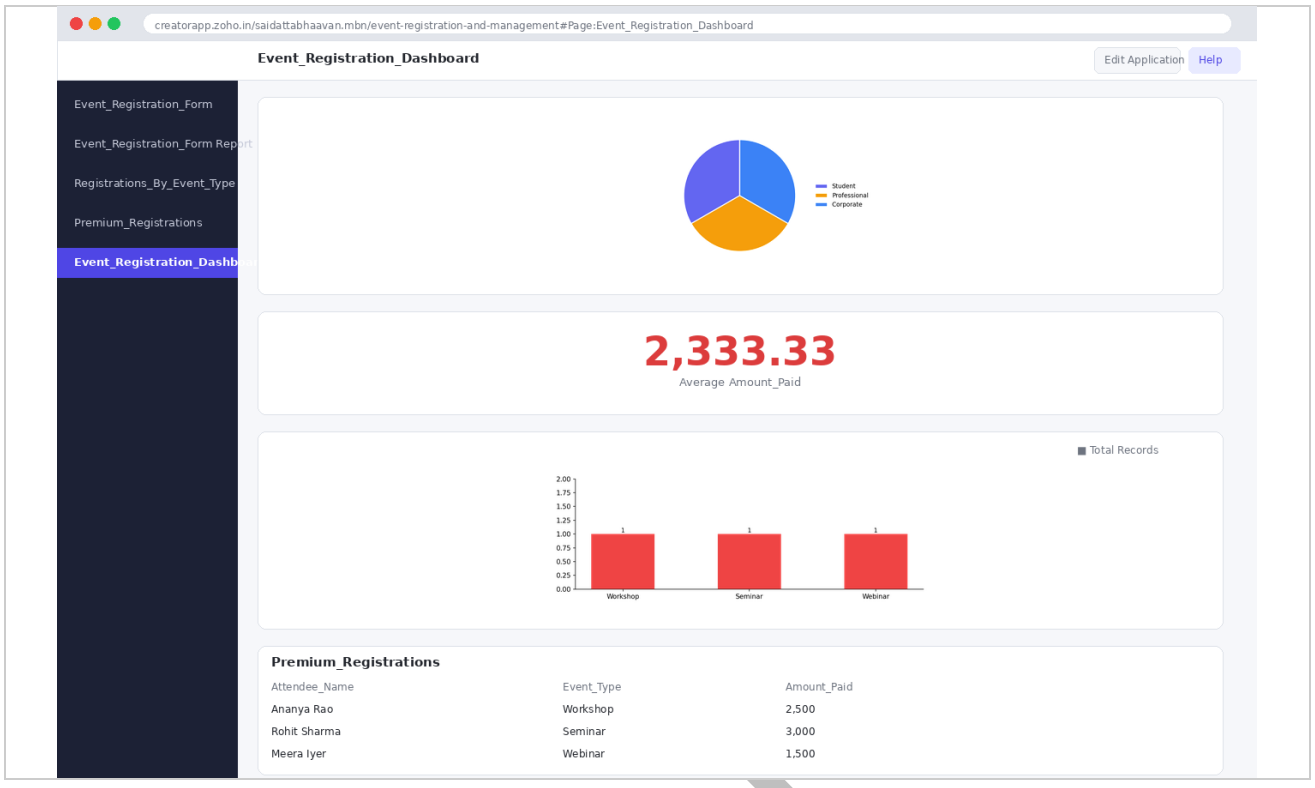

Event_Registration_Dashboard — Pie chart, second KPI panel, Column chart, and embedded Report widget added below the initial widgets

4. Live Dashboard — Rendered View

Live dashboard (top) — Bar chart by Event_Type and the Total Registrations KPI panel showing 3

Live dashboard (continued) — Pie chart by Attendee_Type, Average Amount_Paid panel, Column chart by Event_Type, and the embedded Premium_Registrations report table

24140

RESULT

Multiple report views — a Kanban view grouped by Event_Type and a filtered list report — were successfully created on top of the Event_Registration_Form data in Zoho Creator, and a summary dashboard Page was designed using the drag-and-drop UI Builder, combining six widgets: a Bar chart, a Count KPI panel, a Pie chart, an Average KPI panel, a Column chart, and an embedded report table. The dashboard was verified to correctly reflect the three submitted sample event registrations across every widget — the charts showing their distribution by event type and attendee type, the panels showing the total registration count and average amount paid, and the embedded table showing the underlying attendee records. The exercise thus demonstrated a broader understanding of Zoho Creator's Reports and Pages capabilities for visualising and summarising business application data from multiple angles on a single dashboard.
