EXPERIMENT 9

Exploring AI-Assisted Features and Built-in Analytics (Zia) in Zoho Creator — Event Registration Application

Name: Vaideeshwari K **Roll Number:** 241401121

Title

Exploring AI-Assisted Features and Built-in Analytics (Zia) in Zoho Creator – Event Registration Application.

Aim

To explore the built-in analytics, dashboard charts and report display options of the Event Registration application in Zoho Creator, and to check the availability of AI-assisted (Zia) features in the account.

Objectives

• To observe the dashboard layout: KPI cards, charts and the All Event Registrations report.
• To record dashboard figures and study the Participant Type column chart and Event Track donut chart.
• To identify report display formats through the Show As menu and view records as a Kanban board.
• To audit the account for Zia AI assistance and record its limitations.

Software / Tools Required

• Zoho Creator • Event Registration application • Web browser with internet connection • Zoho account with application access

Introduction / Theory

AI-Assisted Features and Zia: AI-assisted low-code features help users build applications and understand data through insights, questions or suggestions. Zia is Zoho's AI assistant. Availability depends on the edition, plan and interface version.

Built-in Analytics and Dashboards: Zoho Creator dashboards present application data visually. KPI cards show key figures; charts compare categories or proportions; reports display structured records; interactive visualizations can reveal values on hover.

Dashboard Screenshot

Procedure

1. Open Zoho Creator and sign in. Locate the Event Registration application.
2. Open the application and select **Access this application** to enter its live view.
3. Observe the dashboard, which contains participant summaries, charts and the Event_Registration_Form report.

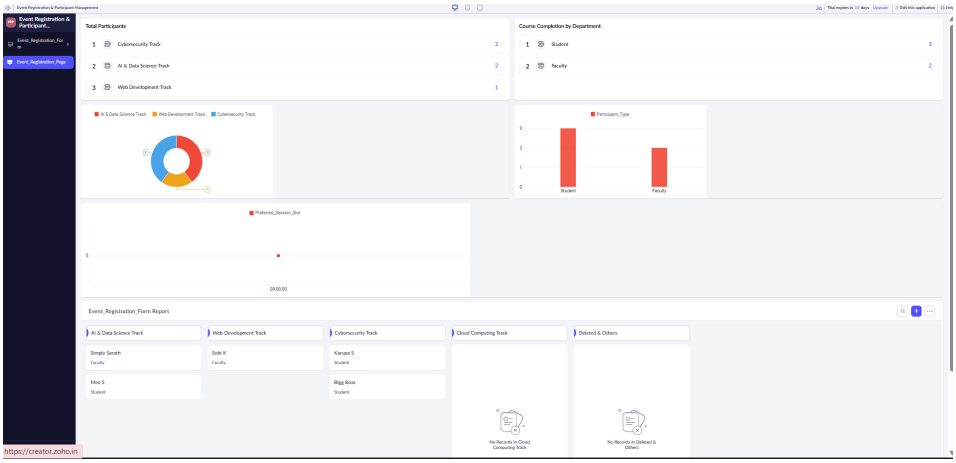

Figure 9.2: Event Registration dashboard used to identify report and chart components.

4. Record the figures visible in the dashboard: Cybersecurity Track – 2; AI & Data Science Track – 2; Web Development Track – 1. The participant summary shows Student – 3 and Faculty – 2.

5. Examine the donut chart for track distribution, the column chart for participant type, and the Preferred_Session_Slot chart, which shows a point at 09:00:00 with value 5.

6. Open the report's three-dot options menu. The original experiment documents List, Calendar, Timeline, Spreadsheet, Kanban and Map, together with Print.

Report Display Formats

Option	Description
List	Records displayed as rows in a table.
Calendar	Records arranged by a date field.
Timeline	Records arranged chronologically.
Spreadsheet	Grid similar to a spreadsheet.
Kanban	Cards grouped into lanes by a selected field.
Map	Records plotted using location data.

241401121

Procedure (Continued)

7. Select a suitable report display option from the available menu. The original experiment notes List, Calendar, Timeline, Spreadsheet, Kanban and Map. Kanban presents records as cards grouped into lanes.

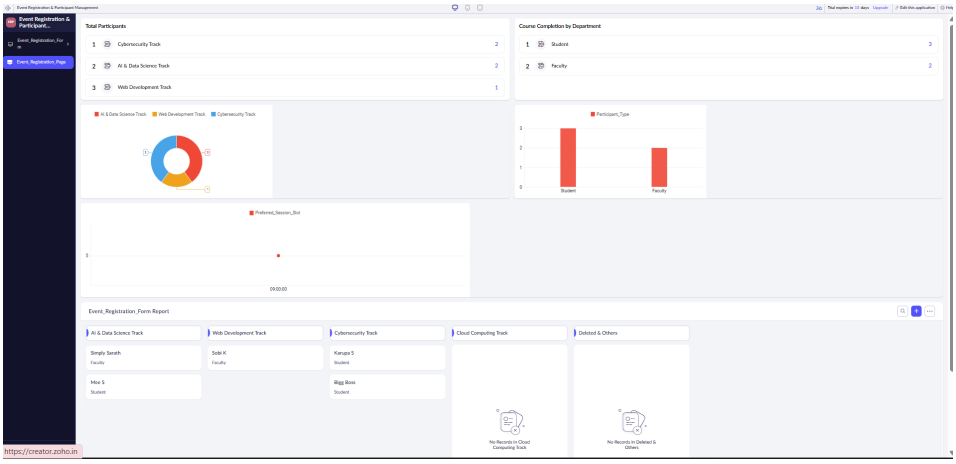

Figure 9.3: Dashboard screenshot reused in place of the original report-menu image, as requested.

8. Review the report cards below the charts. In the supplied dashboard screenshot, records are grouped into AI & Data Science Track, Web Development Track, Cybersecurity Track, Cloud Computing Track, and Deleted & Others.

9. Check for Zia / AI-assisted options. The original lab record states that Zia AI assistance was not used, configured or demonstrated in the account; availability may depend on the account edition and plan.

Dashboard Analytics

Dashboard Item	Value Displayed
Cybersecurity Track	2
AI & Data Science Track	2
Web Development Track	1
Participant Type / Department	Student: 3; Faculty: 2
Preferred_Session_Slot	09:00:00; value 5

241401121

System Architecture and Zia Audit

The form stores registrations, the report presents records in available layouts, and the dashboard combines summary components, charts and the report on one page. The supplied screenshot shows participant summaries, charts and grouped report cards in the same interface.

The original lab record states that Zia AI assistance was not used, configured or demonstrated in the account. Advanced AI features may depend on the account edition and plan.

Observation

The current dashboard presents participant counts and visual summaries together. The charts summarize track distribution, participant type/department and preferred session slot; report cards are grouped by technical track.

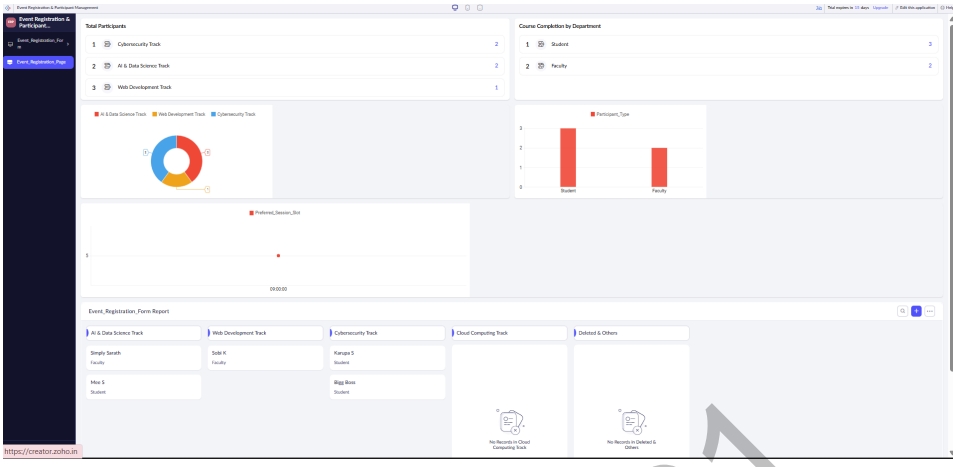

Figure 9.4: Dashboard screenshot reused for the observation section.

Summary of Observations

The current dashboard screenshot is used for all figures in this report. It shows Cybersecurity – 2, AI & Data Science – 2, Web Development – 1, Student – 3 and Faculty – 2. Report display options and Kanban concepts are described in the procedure.

241401121

Result

- The dashboard was inspected and the visible track and participant counts were recorded.
- The donut chart, participant-type column chart and Preferred_Session_Slot chart were identified.
- Report display formats and the Kanban concept were reviewed from the original experiment notes.
- Zia AI assistance was not used or demonstrated in the account, according to the original lab record.
