Event Registration Form — Basic Fields Use Case

17th August 2026

VAIDEESHWARI K

Reg. No: 241401121 | B.Tech CSBS

AIM

To design and build a functional "Event Registration" application in a low-code platform (Zoho Creator) that demonstrates the correct usage of Basic Fields available in the Form Builder — Name, Radio, Number, Email, Phone, Single Line, Address, Drop Down, Multi Select, Multi Line, Date, Time, and Checkbox — and to model the underlying data structure of an event registration workflow through a properly configured form, an auto-generated report view, and an Entity-Relationship (ER) diagram.

PROCEDURE

1. Application and Form Creation

- Logged into the low-code platform and created a new application named "Event Registration Form".
- Inside the application, opened the Form Builder and created the Event_Registration_Form, which holds all fields required for participant intake.
- This automatically created a linked report, Event_Registration_Form Report, which lists every submitted registration.

2. Drag-and-Drop of Basic Fields

In the Form Builder, the Basic Fields palette was expanded on the left panel. Each required field was dragged from the palette and dropped onto the canvas in the order needed, then configured through its Field Properties panel, as listed below.

Basic Field	Field Name Set	Drag-and-Drop Configuration
Name	Participant Name	Dropped onto canvas; enabled First Name / Last Name sub-fields; Last Name display kept; marked as containing personal data (PII).
Radio	Participant Type	Mutually exclusive choice options (Choice 1 / Choice 2 / Choice 3) to categorise participants, e.g. Student, Faculty, Professional.
Number	Team Size	Plain numeric entry field for the number of members in the participant's team.

241401121

Basic Field	Field Name Set	Drag-and-Drop Configuration
Email	Email	Dropped after Team Size; built-in email format validation left active.
Phone	Contact Number	Dropped after Email; country code format set to India (+91).
Single Line	College	Short free-text field to capture the participant's institution name.
Address	Institution Address	Default Address Line 1, Address Line 2, City/District, State/Province, Postal Code and Country sub-fields kept.
Drop Down	Event Track	Choice list populated with the tracks the participant may attend.
Multi Select	Areas of Interest	Multi-value selection field capturing the topics most relevant to the participant.
Multi Line	Expectations from Event	Expanded text area for what the participant expects to gain from the event.
Date	Preferred Session Date	Standard date picker for the participant's preferred session date.
Time	Preferred Session Slot	Standard time picker for the participant's preferred session slot.
Checkbox	I agree to the event code of conduct	Mandatory acknowledgement confirming the participant accepts the event's rules and guidelines.

3. Configuring Field Properties

- Selected the Participant Name field and enabled the Last Name display option under Display Fields, in addition to the default First Name sub-field.
- Marked the Participant Name field’s Data Privacy section as Contains personal data (PII), since participant names are personally identifiable.
- Reviewed the Field name and Field link name for the Participant Name field, confirming they were set to “Participant Name” and “Participant_Name” respectively.
- Confirmed the Institution Address field’s default Address Line 1, Address Line 2, City/District, State/Province, Postal Code and Country sub-fields render correctly on the live form.
- Set the Contact Number field’s country code format to India (+91), matching the participant demographic.

4. Submitting Sample Records and Reviewing the Report

- Filled and submitted sample registration records through the live form for participants shopna A, vaishu K, and varun sriram.

- Opened the Event_Registration_Form Report in grid view and confirmed all three records appear with Participant Name, Participant Type, Team Size, Email, Contact Number, College, and Institution Address columns visible, showing “Showing 3 of 3” records.
- Verified that every field — Contact Number, College, and Institution Address — correctly stored and displayed the submitted values for each record.

5. Data Modelling

An Entity-Relationship diagram was designed to document the data model underlying the application. The central REGISTRATION entity was linked to PARTICIPANT, INSTITUTION, TEAM, and EVENT_TRACK through one-to-many relationships, since a single participant, institution, team, or event track can be associated with many registrations. REGISTRATION was further linked to SESSION_PREFERENCE through a one-to-many relationship, allowing multiple session date/slot preferences per registration, and to CODE_OF_CONDUCT through a one-to-one relationship representing the participant’s acceptance of the event’s terms.

RESULT

A fully functional Event Registration application was successfully designed and built using a low-code platform, using the required Basic Fields. The Event_Registration_Form correctly captures participant details across Participant Name, Participant Type, Team Size, Email, Contact Number, College, Institution Address, and event preference fields; the auto-generated Event_Registration_Form Report accurately reflects the three submitted records; and the accompanying ER diagram confirms that the underlying data model correctly represents the relationships between participants, their registrations, and related reference data.
